ABSTRACT

An inferred relation weighting process for determining the strength of an inferred relation between a first and a second Internet object which are not directly linked includes a first link weighting process for determining the strength of at least a first link between the first non-directly linked Internet object and a common object. A second link weighting process determines the strength of at least a second link between the second non-directly linked Internet object and the common object. An inferred relation weight calculation process calculates the strength of the inferred relation based on the strength of the at least a first link and the at least a second link.
